Q# 0.10 Language Quick Reference

Primitive Types	
64-bit integers	Int
Double-precision floats	Double
Booleans	Bool
	e.g.: true or false
Qubits	Qubit
Pauli basis	Pauli
	e.g.: PauliI, PauliX, PauliY, or PauliZ
Measurement	Result
results	e.g.: Zero or One
Sequences of	Range
integers	e.g.: 110 or 510
Strings	String
	e.g.: "Hello Quantum!"
"Return no	Unit
information" type	e.g.: ()

Derived Types	
Arrays	elementType[]
Tuples	(type0, type1,) e.g.: (Int, Qubit)
Functions	<pre>input -> output e.g.: ArcCos : (Double) -> Double</pre>
Operations	<pre>input => output is variants e.g.: H : (Qubit => Unit is Adj)</pre>

User-Defined Ty	pes
Declare UDT with anonymous items	newtype <i>Name</i> = (Type, Type); e.g.: newtype <i>Pair</i> = (Int, Int);
Define UDT literal	<pre>Name(baseTupleLiteral) e.g.: let origin = Pair(0, 0);</pre>
Unwrap operator ! (convert UDT to underlying type) Declare UDT with named items	<pre>VarName! e.g.: let originTuple = origin!; (now originTuple = (0, 0)) newtype Name = (Name1: Type, Name2: Type);</pre>
	<pre>e.g.: newtype Complex = (Re : Double, Im : Double);</pre>
Accessing named items of UDTs	<pre>VarName::ItemName e.g.: complexVariable::Re</pre>
Update-and- reassign for named UDT items	<pre>set VarName w/= ItemName <- val; e.g.: mutable p = Complex(0., 0.); set p w/= Re <- 1.0;</pre>

```
Symbols and Variables

Declare immutable symbol

Declare mutable symbol (variable)

Update mutable symbol (variable)

Update mutable symbol (variable)

Apply-and-reassign set varName operator= expression e.g.: set counter += 1;
```

```
Functions and Operations
Define function
                    function Name(in0 : type0, ...)
(classical routine)
                    : returnType {
                         // function body
Call function
                    Name(parameters)
                    e.g.: let two = Sqrt(4.0);
                    operation Name(in0 : type0, ...)
Define operation
(quantum routine)
                    : returnType {
with explicitly
                         body { ... }
specified body,
                         adjoint { ... }
controlled and
                         controlled { ... }
adjoint variants
                         adjoint controlled { ... }
                    operation Name(in0 : type0, ...)
Define operation
with automatically
                    : returnType is Adj + Ctl {
generated adjoint
and controlled
variants
Call operation
                    Name(parameters)
                    e.g.: Ry(0.5 * PI(), q);
Call adjoint
                    Adjoint Name(parameters)
operation
                    e.g.: Adjoint Ry(0.5 * PI(), q);
Call controlled
                    Controlled Name(controlQubits,
operation
                         parameters)
                    e.g.: Controlled Ry(controls,
                         (0.5 * PI(), target));
```

```
Control Flow
Iterate over
                    for (index in range) {
a range of numbers
                         // Use integer index
                    e.g.: for (i in 0..N-1) { ... }
While loop
                    while (condition) {
(within functions)
Iterate over
                    for (val in array) {
an array
                         // Use value val
                    e.g.: for (q in register) { ... }
Repeat-until-
                    repeat { ... }
success loop
                    until (condition)
                    fixup { ... }
Conditional
                    if (cond1) { ... }
statement
                    elif (cond2) { ... }
                    else { ... }
Ternary operator
                    condition ? caseTrue | caseFalse
Return a value
                     return value
Stop with an error
                    fail "Error message"
Conjugations
                     within { ... }
(ABA^{\dagger} \text{ pattern})
                    apply { ... }
```

Arrays						
Allocate array	<pre>mutable name = new Type[length]</pre>					
	e.g.: mutable b = new Bool[2];					
Get array length	Length(<i>name</i>)					
Access k-th element	name[k]					
	NB: indices are 0-based					
Assign k-th element	set name w/= k <- value					
(copy-and-update)	e.g.: set b w/= 0 <- true;					
Array literal	[value0, value1,]					
	e.g.: let b = [true, false, true];					
Array concatenation	array1 + array2					
	e.g.: let t = [1, 2, 3] + [4, 5];					
Slicing (subarray)	name[sliceRange]					
	e.g.: if t = [1, 2, 3, 4, 5], then					
	t[1 3] is [2, 3, 4]					
	t[3] is [4, 5]					
t[1] is [1, 2]						
	t[0 2] is [1, 3, 5]					
	t[1] is [5, 4, 3, 2, 1]					

Debugging (classical)						
Print a string	Message("Hello Quantum!")					
Print an	<pre>Message(\$"Value = {val}")</pre>					
interpolated string

Debugging (quantum)

Print amplitudes of wave function Assert that a qubit is in $|0\rangle$ or $|1\rangle$ state DumpMachine("dump.txt") AssertQubit(Zero, zeroQubit) AssertQubit(One, oneQubit)

Measurements

Measure qubit in Pauli Z basis yields a Result (Zero or One) Reset qubit to $|0\rangle$ Reset an array of qubits to $|0.0\rangle$ ResetAll(register)

Working with Q# from command line

Command Line Basics

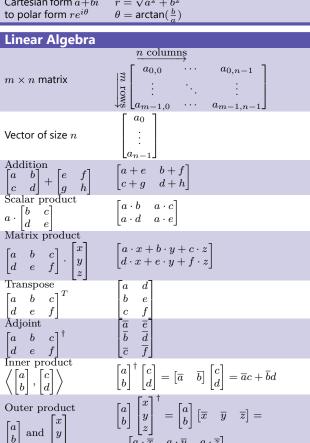

Change directory cd dirname
Go to home cd ~
Go up one directory cd ..
Make new directory mkdir dirname
Open current code .

Working with Q# Projects

Create new project	<pre>dotnet new console -lang Q#output project-dir</pre>
Change directory to project directory	cd project-dir
Build project	dotnet build
Run all unit tests	dotnet test

Math reference

Complex Arithmetic (a+bi)+(c+di)(a+c)+(b+d)i(a+bi)(c+di) $a \cdot c + a \cdot di + b \cdot ci + (b \cdot d)i^2 =$ $= (a \cdot c - b \cdot d) + (a \cdot d + b \cdot c)i$ Complex conjugate $\overline{a+bi} = a-bi$ $\frac{a+bi}{c+di} \cdot 1 = \frac{a+bi}{c+di} \cdot \frac{c-di}{c-di} = \frac{(a+bi)(c+di)}{c^2+d^2}$ Division $\frac{a+bi}{c+di}$ $\sqrt{a^2+b^2}$ Modulus |a + bi| $\cos \theta + i \sin \theta$ e^{a+bi} $e^a \cdot e^{bi} = e^a \cos b + ie^a \sin b$ r^{a+bi} $r^a \cdot r^{bi} = r^a \cdot e^{bi \ln r} =$ $= r^a \cos(b \ln r) + i \cdot r^a \sin(b \ln r)$ Polar form $re^{i\theta}$ to $a = r \cos \theta$ Cartesian form a+bi $b = r \sin \theta$ Cartesian form a+bi $r = \sqrt{a^2 + b^2}$ to polar form $re^{i\theta}$ $\theta = \arctan(\frac{b}{a})$

 $b \cdot \overline{x} \quad b \cdot \overline{y} \quad b \cdot \overline{z}$
